DESCRIPTION OF DATA SOURCE AND SAMPLE POPULATION

Title of Study or Project:

The Military Health and Well-Being Project 2020 (MHWP) from the online repository, ICPSR Michigan

Purpose for the data collection:

The purpose of the study was to collect information regarding psychosocial antecedents of health and wellness, including military identity, self-stigma, daily stress, combat exposure, purpose and value, substance use, traumatic brain injury, moral injury, suicide risk, social integration and contribution, and six of eight Substance Abuse and Mental Health Services Administration (SAMHSA) dimensions of wellness (social, emotional, spiritual, intellectual, physical, and environmental components for this study).

Agency: North Carolina State University 2019 Non-Laboratory Research Scholarship Program.

Principal Investigator (PI)/Funder:

Sarah L. Desmarais

Website address:

<https://www.icpsr.umich.edu/web/ICPSR/studies/38304>

The process of gaining access to the dataset:

UTEP belongs to the international consortium ICPSR Michigan, an online repository of open-source datasets. The keywords “well-being,” “military service,” and “veteran” were used to identify the dataset.

Study Participants:

Veterans of the US military who served post-Vietnam, aged 18 and older at the time of data collection, who resided in the United States. Qualtrics Panels service was used for data collection. Black and female veterans were oversampled since these groups have been historically under-represented in veteran studies (Schafer, 2024).

Sample Size (n): 1,495

Year data was collected: 2020

MULTIPLE LINEAR REGRESSION HYPOTHESIS

Protective Factors

H_o : Among veterans, the protective factors* are NOT independently associated with alcohol and drug abuse risk.

H_a : Among veterans, the protective factors* are independently associated with alcohol and drug abuse risk.

*Calling and Purpose, Community Engagement, Help-Seeking Behaviors, Military Calling, Quality of Life, Public Service Motivation, and Overall Wellness.

MULTIPLE LINEAR REGRESSION HYPOTHESIS

Risk Factors

H_o : Among veterans, the risk factors* are NOT independently associated with alcohol and drug abuse risk.

H_a : Among veterans, the risk factors* are independently associated with alcohol and drug abuse risk.

*Combat Exposure, Daily Stress Status, Loneliness Level, Degree of Moral Injury, Self-Stigmatization Level, Suicide Risk Status, and History of Traumatic Brain Injury.

MULTIPLE LINEAR REGRESSION HYPOTHESIS

Buffering Effect

H_o: Among veterans, the protective* do not buffer the risk factors** associated with alcohol and drug abuse risk.

H_a: Among veterans, the protective factors* do buffer the risk factors** associated with alcohol and drug abuse risk.

***Protective Factors** = Calling and Purpose, Community Engagement, Help-Seeking Behaviors, Military Calling, Quality of Life, Public Service Motivation, and Overall Wellness.

****Risk Factors** = Combat Exposure, Daily Stress, Loneliness, Moral Injury, Self-Stigmatization, Suicide Risk, and History of Traumatic Brain Injury

MULTIPLE LINEAR REGRESSION

Research Aims

1. What is the association of protective* and risk factors** with alcohol abuse and drug risk use among US Veterans?
2. What is the buffering effect of protective factors* on the risk factors** related to alcohol and drug abuse risk in US Veterans?
3. When evaluating all the factors simultaneously, which construct accounts for the greatest variability in alcohol and drug abuse risk, an exploratory approach?

***Protective Factors** = Calling and Purpose, Community Engagement, Help-Seeking Behaviors, Military Calling, Quality of Life, Public Service Motivation, and Overall Wellness.

****Risk Factors** = Combat Exposure, Daily Stress, Loneliness, Moral Injury, Self-Stigmatization, Suicide Risk, and History of Traumatic Brain Injury

MULTIPLE LINEAR REGRESSION HYPOTHESIS

Assumptions And Missing Values

Variables —The dataset variables used in this project were all composite, scalable variables derived from the summation of the related metrics questions. Within the analysis, the composite variables were used in their continuous state. This is a reasonable assumption since the overall scores measure the degree of the screening tools. The exceptions are the nominal variable RACE, the binary variable TBI, and the continuous variables AGE and INCOME.

Confounders – Age, gender, race, and socioeconomic status (proxy is income) are known confounders for alcohol and drug abuse risk and are used in the modeling (Brown 1995).

Income – Based on the IQR rule, there were 56 outliers. Descriptive Statistics included analysis with and without outliers. The data without outliers was used for analysis.

MULTIPLE LINEAR REGRESSION HYPOTHESIS

Assumptions And Missing Values

Suicide Risk Variable—There were 26 missing values, representing 1.7% of the total sample size of 1,495. The mean for the variable (5.298) was imputed for the missing value.

Analyses

Regression — An R-value of ≥ 0.5 and ≤ -0.5 was considered statistically significant

p-value — A p-value of <0.05 was considered statistically significant

Linear Regression Analysis — Saturated models of the protective and risk factors were independently performed. A combined, saturated model of protective and risk factors was then performed. The final reduced model of only those variables that were statistically significant to the combined saturated model was then performed.

Variables

MULTIPLE LINEAR REGRESSION

Data Management

Dependent Variable	Units/Levels/Missing Values Code
Y: Alcohol and Drug Abuse Risk (Continuous) (CAGEAID_TOTAL) CAGEAID_TOTAL is the summation of CAGEAID_1 through CAGEAID_5	Units/Range (Min, Max): Scale /4 (0,4) Missing Values None

MULTIPLE LINEAR REGRESSION

Data Management

Independent Variables (Protective Behaviors)	Units/Levels/Missing Values Code
X_{p1}: Calling and Purpose (Continuous) (PUR_TOTAL) Recoded from the summation of PURPOSE_1 through PURPOSE_5	Units/Range (Min, Max): Scale /20 (5,25) Missing Values None
X_{p2}: Community Engagement (Continuous) (SOC_TOTAL) Recoded from (SOC_TOTAL = SOC_INT_TOTAL + SOC_CON_TOTAL) (SOC_INT_TOTAL = SOC_INTEGRATION_1R, + 2 +3) (SOC_CON_TOTAL =SOC_CONTRIBUTION_1 + 2R + 3R)	Units/Range (Min, Max): Scale / 24 (12, 36) Missing Values None

MULTIPLE LINEAR REGRESSION

Data Management

Independent Variables (Protective Behaviors)	Units/Levels/Missing Values Code
<p>X_{p3}: Help-seeking Behaviors (Continuous) (HELP_TOTAL)</p> <p>Recoded from summation of HELP_SEEKING_1 through HELP_SEEKING_3</p>	<p>Units/Range (Min, Max): Years / 18 (3, 21)</p> <p>Missing Values None</p>
<p>X_{p4}: Military Calling (Continuous) (MIL_CALL)</p> <p>Recoded from summation of NPIS_1 through 3</p>	<p>Units/Range (Min, Max): Years /18 (3, 21)</p> <p>Missing Values None</p>

MULTIPLE LINEAR REGRESSION

Data Management

Independent Variables (Protective Behaviors) Units/Levels/Missing Values Code	
X_{p5}: Quality of Life (Continuous) (WHO_TOTAL) Recoded from WHO1 through WHO26 with reverse codes for (3R, 4R, and 26R).	Units/Range (Min, Max): Scale / 104 (26, 130) Missing Values None
X_{p6}: Public Service Motivation (Continuous) (PUB_SER) Recoded from the summation of PUBLIC_1 through PUBLIC_5	Units/Range (Min, Max): Scale / 20 (5, 25) Missing Values None

MULTIPLE LINEAR REGRESSION

Data Management

Independent Variables (Protective Behaviors) Units/Levels/Missing Values Code	
<p>X_{p7}: Overall Wellness Level (WELL_MAG)</p> <p>Recoded from WELLNESS_1 through 30 with reverse codes for 2, 6, 8, 9, 10, 12, 14, 17, 21, 23, 24, 26, 30.</p>	<p>Units/Range (Min, Max): Scale / 110 (40, 150)</p> <p>Missing Values None</p>

MULTIPLE LINEAR REGRESSION

Data Management

Independent Variables (Risk Factors)

Units/Levels/Missing Values Code

X_{N1}: Combat Exposure (Continuous)
(COM_TOTAL)

Recoded COM_TOTAL = Summation of CES_1 through CES_7

Units/Range (Min, Max):
Scale / 28 (7, 35)

Missing Values
None

X_{N2}: Daily Stress (Continuous)
(STRESS_TOTAL)

Recoded STRESS_TOTAL as summation of STRESS_1 through STRESS_7

Units/Range (Min, Max):
Scale / 7 (0, 7)

Missing Values
None

MULTIPLE LINEAR REGRESSION

Data Management

Independent Variables (Risk Factors)	Units/Levels/Missing Values Code
<p>X_{N3}: Loneliness (Categorical) (LONE_TOTAL)</p> <p>Recoded LONE_TOTAL from summation of LONELINESS_1 through LONELINESS_3</p>	<p>Units/Range (Min, Max): Scale / 6 (3, 9)</p> <p>Missing Values None</p>
<p>X_{N4}: Moral Injury (Categorical) (MOR_INJ)</p> <p>Recoded MOR_INJ from the summation of MISSSF_1 through MISSSF_11 using reverse for 5R, 6R, 7R, 9R and 10R.</p>	<p>Units/Range (Min, Max): Scale / 87 (11, 98)</p> <p>Missing Values None</p>

MULTIPLE LINEAR REGRESSION

Data Management

Independent Variables (Risk Factors)	Units/Levels/Missing Values Code
<p>X_{N5}: Self-Stigma (Continuous) (STIGMA)</p> <p>Recoded from the summation of DD_1 through DD_4</p>	<p>Units/Range (Min, Max): Scale / 24 (4, 28)</p> <p>Missing Values None</p>
<p>X_{N6}: Suicide-Risk Status(Binary) (SUICIDE_TOTAL)</p> <p>Recoded SUICIDE_TOTAL = the summation of SBQ_1 through SBQ_4</p>	<p>Units/Range (Min, Max): Scale / 28 (7, 35)</p> <p>Missing Values There are 26 missing values (1.7%) The mean was imputed for the missing values.</p>

MULTIPLE LOGISTIC REGRESSION
Data Management

Independent Variables (Risk Factors)	Units/Levels/Missing Values Code
X_{N7}: History of Traumatic Brain Injury (TBI) (TBI)	Levels / Coding: 0 No 1 Yes

MULTIPLE LINEAR REGRESSION

Data Management

Confounding Variables (Brown, 1995)	Units/Levels/Missing Values Code
X_{C1}: Age (Continuous) (AGE)	Units/Range (Min, Max): Years / 68 (18,86) Missing Values None
X_{C2}: Gender (Categorical – three levels) (GENDER)	Levels 1 Male 2 Female 3 Other Missing Values None

MULTIPLE LINEAR REGRESSION

Data Management

Confounding Variables (Brown, 1995)	Units/Levels/Missing Values Code
X_{c1}: Race (Categorical – 6 levels) (RACE_R) Recoded to 2 levels White and Non-White. White includes Hispanics.	Levels 1 White 2 Non-White
X_{c2}: Income (Continuous) (INCOME_WO) Recoded to INCOME_WO from INCOME with the removal of the 56 outliers	Units/Range (Min, Max): \$ USD / 24 (0, 200,000) Missing Values None

Results

DESCRIPTIVE STATISTICS

The 2022 Military Health and Well-Being Project from ICPSR Michigan (N=1,495)

Table 3 Descriptive Statistics for Dataset Variables		N	Median (Q1, Q3)	Frequency (%)
Age (years)		1495	68.0 (18.0, 86.0)

MULTIPLE LINEAR REGRESSION HYPOTHESIS

Protective Factors* Model 1a (adjusted for confounders**)

H_0 : Among veterans, the protective factors* are NOT independently associated with alcohol abuse risk.

H_a : Among veterans, the protective factors* are independently associated with alcohol abuse risk.

Reject the H_0

The Protective Factors adjusted for confounders are **independently associated** with Alcohol and Drug Abuse Risk ($p < 0.001$).

*Protective Factors = Calling and Purpose, Community Engagement, Help-Seeking Behaviors, Military Calling, Quality of Life Score, Public Service Motivation and Overall Wellness

**Confounding Factors = Age, Gender, Race, and Income (Brown, 1995)

MULTIPLE LINEAR REGRESSION HYPOTHESIS

Risk Factors* Model 3a (adjusted for confounders**)

H_0 : Among veterans, the risk factors* are NOT independently associated with alcohol abuse risk.

H_a : Among veterans, the risk factors* are independently associated with alcohol abuse risk.

Reject the H_0

The Risk Factors adjusted for confounders are **independently associated** with Alcohol and Drug Abuse Risk ($p < 0.001$).

* **Risk Factors** = Combat Exposure, Daily Stress, Loneliness, Moral Injury, Self-Stigmatization, Suicide Risk, and History of Traumatic Brain Injury

****Confounding Factors** = Age, Gender, Race, and Income (Brown, 1995)

MULTIPLE LINEAR REGRESSION HYPOTHESIS

Saturated Model 5a Comparision to Models 1a and 3a

Buffering Effect

(adjusted for confounders***)

H_0 : Among veterans, the protective* do not buffer the risk factors** associated with alcohol abuse risk.

H_a : Among veterans, the protective factors* do buffer the risk factors** associated with alcohol abuse risk.

Accept the H_0

Since the alcohol and drug abuse risk is primarily attributed to the risk factors without significant change when the protective factors are added, it suggests that the protective factors **do not buffer** the risk factors associated with alcohol and drug abuse risk.

***Protective Factors** = Calling and Purpose, Community Engagement, Help-Seeking Behaviors, Military Calling, Quality of Life, Public Service Motivation, and Overall Wellness.

****Risk Factors** = Combat Exposure, Daily Stress, Loneliness, Moral Injury, Self-Stigmatization, Suicide Risk, and History of Traumatic Brain Injury.

*****Confounders** = Age, Gender, Race, and Income (Brown, 1995)

MULTIPLE LINEAR REGRESSION

Research Aims

1. **What is the association of protective* and risk factors** with alcohol abuse and drug risk use among US Veterans?**

There is a **correlation** between Alcohol and Drug Abuse Risk and combined, saturated model (5a) adjusted for confounding factors ($R = 0.5181$)

2. **What is the buffering effect of protective factors* on the risk factors** related to alcohol and drug abuse risk in US Veterans?**

Since the alcohol and drug abuse risk is primarily attributed to the risk factors without significant change when the protective factors are added, it suggests that the protective factors **do not buffer** the risk factors associated with alcohol and drug abuse risk.

3. **When evaluating all the factors simultaneously, which construct accounts for the greatest variability in alcohol and drug abuse risk, an exploratory approach?**
Daily Stress (0.124)

***Protective Factors** = Calling and Purpose, Community Engagement, Help-Seeking Behaviors, Military Calling, Quality of Life, Public Service Motivation, and Overall Wellness.

****Risk Factors** = Combat Exposure, Daily Stress, Loneliness, Moral Injury, Self-Stigmatization, Suicide Risk, and History of Traumatic Brain Injury

*** **Confounders** = Age, Gender, Race, and Income

MULITPLE LINEAR REGRESSION SUMMARY TABLES

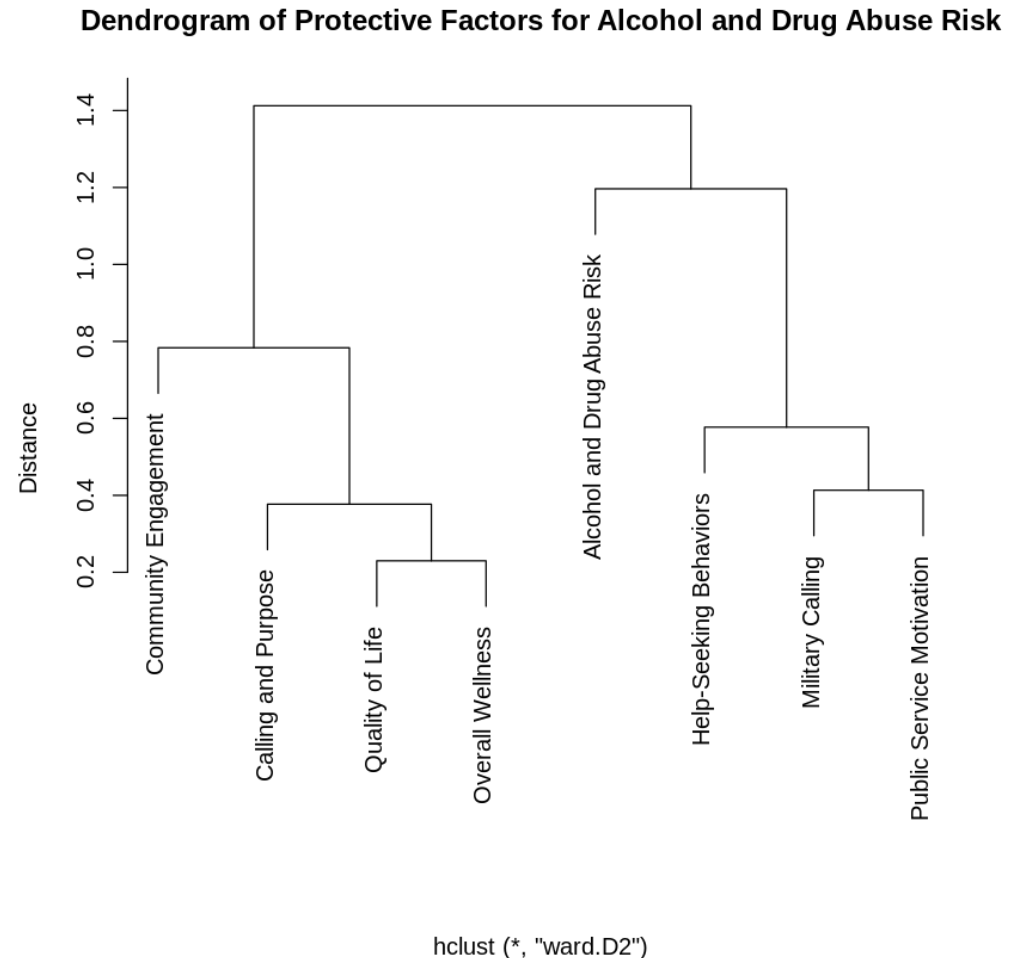

Table 3 Protective and Risk Factors Independently Associated with Alcohol and Drug Abuse Risk using Cohen F among Veterans in The 2022 Military Health and Well-Being Project from ICPSR Michigan (N=1,495) (adjusted for confounders)

Variables	Effect Size (sr²)	Interpretation
Calling and Purpose	0.0083	Very small
Community Engagement	0.0002	Negligible
Help-Seeking Behavior	0.015	Small
Military Calling	0.0003	Negligible
Quality of Life	0.0026	Very small
Public Service Motivation	0.0001	Negligible
Overall Wellness	0.0002	Negligible
Combat Exposure	0.0155	Small
Daily Stress	0.1541	Medium to large
Loneliness	0.0243	Small
Moral Injury	0.0773	Medium
Self-Stigmatization	0.0016	Very small
Suicide Risk	0.2313	Large
History of Traumatic Brain Injury	0.0001	Negligible
Age	0	Negligible
Gender	0.0785	Medium
Race	0.0151	Small
Income	0.0088	Very small

MULTIPLE LINEAR REGRESSION

Dendrogram for Protective Factors

Figure 2

Interpretation Statement

The dendrogram suggests there may be collinearity between Quality of Life and Overall Wellness and between Military Calling and Public Service Motivation.

MULITPLE LINEAR REGRESSION Summary Tables

Table 5: Variance Inflation Factors for the Protective Factors* Model among Veterans in The 2022 Military Health and Well-Being Project from ICPSR Michigan (N=1,495)

Measures	Variance Inflation Factors
Calling and Purpose	1.594
Community Engagement	2.388
Help-Seeking Behavior	1.359
Military Calling	1.531
Quality of Life	2.628
Public Service Motivation	2.038
Overall Wellness	3.385

*Calling and Purpose, Community Engagement, Help-Seeking Behaviors, Military Calling, Quality of Life Score, Public Service Motivation and Wellness

Interpretation Statement

The Variance Inflation Factors (VIF) for the Protective Factors for Alcohol and Drug Abuse are below 5. Therefore, it suggests a **moderate or low correlation** between predictor variables, indicating that multicollinearity is **unlikely to significantly impact the regression model**. However, the highest VIF value (3.385) suggests some degree of correlation, but it is still within an acceptable range.

MULTIPLE LINEAR REGRESSION

Dendrogram for Risk Factors

Figure 4

Interpretation Statement

The dendrogram suggests there **may not** be collinearity between the risk factors.

MULITPLE LINEAR REGRESSION Summary Tables

TABLE 8: Variance Inflation Factors for the Risk Factors* among Veterans in The 2022 Military Health and Well-Being Project from ICPSR Michigan (N=1,495)

Measures	Variance Inflation Factors
Combat Exposure	1.193
Daily Stress	1.349
Loneliness	1.472
Moral Injury	2.052
Self-Stigmatization	1.299
Suicide Risk	1.448
History of Traumatic Brain Injury	1.075

*Combat Exposure, Daily Stress, Loneliness, Moral Injury, Self-Stigmatization, Suicide Risk, and History of Traumatic Brain Injury

Interpretation Statement

The Variance Inflation Factors (VIF) for the Risk Factors for Alcohol and Drug Abuse are below 5. Therefore, it suggests a **moderate or low correlation** between predictor variables, indicating that multicollinearity is **unlikely to significantly impact the regression model**.

MULTIPLE LINEAR REGRESSION

Regression Analysis Protective Factors (adjusted for confounders)

Interpretation Statements

There is **no correlation** between Alcohol and Drug Abuse Risk and the Protective Factors ($R = 0.381$).

17.1 % of the variance in Alcohol and Drug Abuse Risk is explained by the Protective Factors.

The Protective Factors are **independently associated** with Alcohol and Drug Abuse Risk ($p < 0.001$).

Among the Protective Factors, **Calling and Purpose** contributed the greatest to the variance (0.0186) to Alcohol and Drug Abuse Risk; however, it was not statistically significant.

Quality of Life (-0.0158) and **Overall Wellness** (-0.0098) contributed less; however, they were statistically significant.

MULTIPLE LINEAR REGRESSION

Regression Analysis Protective Factors (adjusted for confounders)

Interpretation Statements

After adjusting for Calling and Purpose, Community Engagement, Help-Seeking Behaviors, Military Calling, Public Service Motivation, and Overall Wellness, **Quality of Life is significantly associated** with Alcohol and Drug Risk Abuse ($p < 0.001$).

After adjusting for Calling and Purpose, Community Engagement, Help-Seeking Behaviors, Military Calling, Public Service Motivation, and Quality of Life, **Overall Wellness is significantly associated** with Alcohol and Drug Risk Abuse ($p < 0.001$).

MULTIPLE LINEAR REGRESSION

Correlation Plot Between All Model 1 Protective Factor* and Alcohol and Drug Abuse Risk

*Calling and Purpose, Community Engagement, Help-Seeking Behaviors, Military Calling, Quality of Life Score, Public Service Motivation and Wellness

MULTIPLE LINEAR REGRESSION

Dendrogram for Protective Factors

Interpretation Statement

The dendrogram suggests there may be collinearity between Quality of Life and Overall Wellness and between Military Calling and Public Service Motivation.

MULITPLE LINEAR REGRESSION Model 1 Summary Tables

TABLE 2: Variance Inflation Factors for the Model 1 Protective Factors* among Veterans in The 2022 Military Health and Well-Being Project from ICPSR Michigan (N=1,495)

Measures	Variance Inflation Factors
Calling and Purpose	1.594
Community Engagement	2.388
Help-Seeking Behavior	1.359
Military Calling	1.531
Quality of Life	2.628
Public Service Motivation	2.038
Overall Wellness	3.385

*Calling and Purpose, Community Engagement, Help-Seeking Behaviors, Military Calling, Quality of Life Score, Public Service Motivation and Wellness

Interpretation Statement

The Variance Inflation Factors (VIF) for the Protective Factors for Alcohol and Drug Abuse are below 5. Therefore, it suggests a **moderate or low correlation** between predictor variables, indicating that multicollinearity is **unlikely to significantly impact the regression model**. However, the highest VIF value (3.385) suggests some degree of correlation, but it is still within an acceptable range.

MULTIPLE LINEAR REGRESSION

Regression Analysis Model 1 Protective Factors

R and R²

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	0.3812 ^a	0.1453	0.1412	1.215

a. Predictors: (Constant), Calling and Purpose, Community Engagement, Help-Seeking Behaviors, Military Calling, Quality of Life Score, Public Service Motivation and Wellness

Interpretation Statements

There is no correlation between Alcohol and Drug Abuse and Calling and Purpose, Community Engagement, Help-Seeking Behaviors, Military Calling, Quality of Life Score, Public Service Motivation and Wellness (R = 0.381).

14.1 % of the variance in Alcohol and Drug Abuse is explained by Calling and Purpose, Community Engagement, Help-Seeking Behaviors, Military Calling, Quality of Life Score, Public Service Motivation, and Wellness.

MULTIPLE LINEAR REGRESSION

Regression Analysis for Model 1

Regression Equation with Legend

Equation:

$$Y = 2.999 + 0.020 \cdot X_{p1} + 0.001 \cdot X_{p2} + 0.031 \cdot X_{p3} - 0.020 \cdot X_{p4} - 0.013 \cdot X_{p5} + 0.021 \cdot X_{p6} - 0.0159 \cdot X_{p7} + e$$

Legend:

- Y = Alcohol and Drug Abuse Risk
- X_{p1} = Calling and Purpose
- X_{p2} = Community Engagement
- X_{p3} = Help-Seeking Behavior
- X_{p4} = Military Calling
- X_{p5} = Quality of Life
- X_{p6} = Public Service Motivation
- X_{p7} = Overall Wellness

e = error term

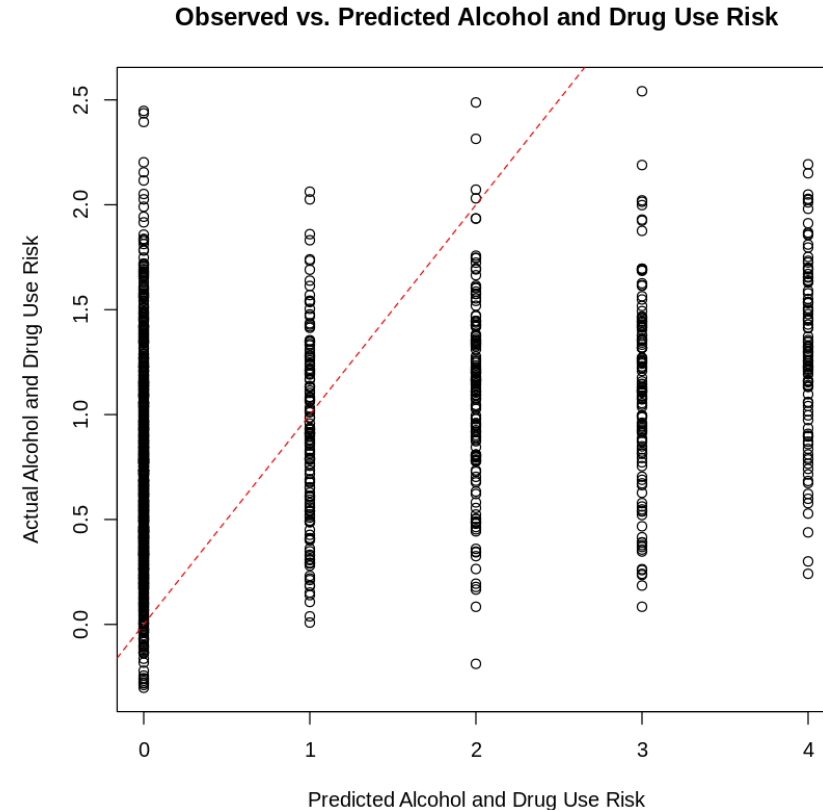

Model		Coefficients ^a		t	Sig.
		B	Std. Error		
1	(Constant)	2.999	0.267	11.197	
	Calling and Purpose	0.020	0.013	1.552	0.121
	Community Engagement	0.001	0.009	0.119	0.906
	Help-Seeking Behavior	0.031	0.009	3.590	<0.001
	Military Calling	-0.020	0.011	-1.971	0.059
	Quality of Life Score	-0.013	0.003	-4.610	<0.001

	Overall Wellness	-0.0159	0.003	-5.486	<0.001

a. Dependent Variable: Alcohol and Drug Abuse

MULTIPLE LINEAR REGRESSION

REGRESSION DIAGNOSTICS

Y versus Y –estimate Scatterplot?

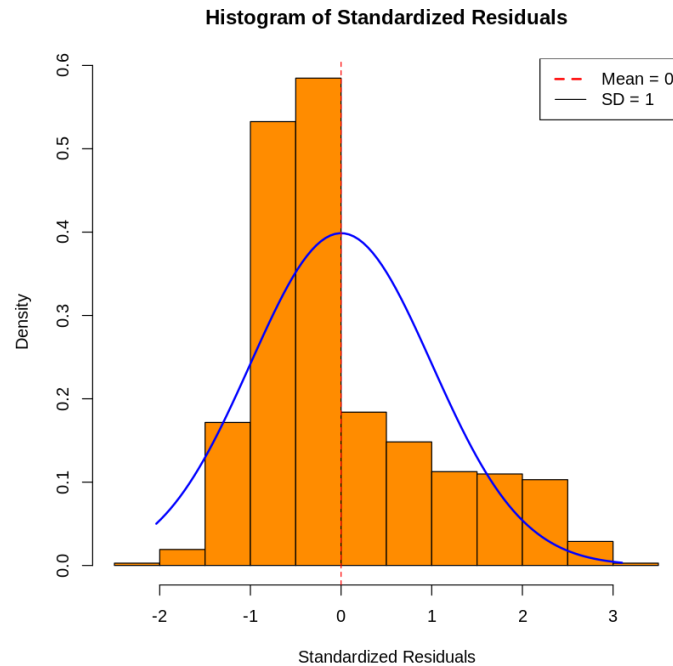

Interpretation Statement

There is no strong positive linear pattern. Hence, this model is NOT a good predictor of Y.

MULTIPLE LINEAR REGRESSION

REGRESSION DIAGNOSTICS

Standardized Error Terms Histogram

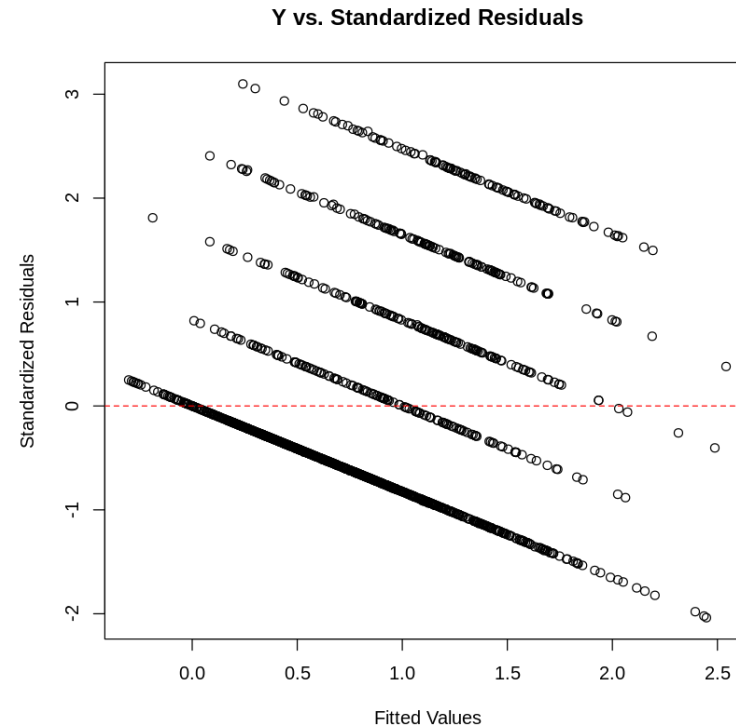

Interpretation Statement

Error terms are small. The mean is close to 0, with most values are between -2 and 2. The histogram for the STDE is not bell-shaped and symmetric. Therefore, this model is NOT a good predictor of Y.

MULTIPLE LINEAR REGRESSION

REGRESSION DIAGNOSTICS

Y versus Standardized Error Terms Scatterplot?

Interpretation Statement

The scatterplot does not show a pattern. Y increases as STDE decreases. Most of the STDE terms are between (-2, 2). Hence, this model is NOT a good predictor of Y.

MULTIPLE LINEAR REGRESSION MODEL 1 SUMMARY TABLES

*Combat Exposure, Daily Stress, Loneliness, Moral Injury, Self-Stigmatization, Suicide Risk, and History of Traumatic Brain Injury

MULTIPLE LINEAR REGRESSION

Regression Analysis Model 3 Risk Factors

R and R²

Model Summary				
Model 3	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	0.4913 ^a	0.2414	0.2383	1.144

a. Predictors: (Constant), Combat Exposure, Loneliness, Moral Injury, Self-Stigmatization, Suicide Risk, History of Traumatic Brain Injury

Interpretation Statements

There is no correlation between Alcohol and Drug Abuse Risk and Combat Exposure, Loneliness, Moral Injury, Self-Stigmatization, Suicide Risk, and History of Traumatic Brain Injury (R = 0.491).

23.8 % of the Variance in Alcohol and Drug Abuse Risk is explained by Combat Exposure, Loneliness, Moral Injury, Self-Stigmatization, Suicide Risk, and History of Traumatic Brain Injury

MULTIPLE LINEAR REGRESSION

Regression Analysis Model 3

Regression Equation with Legend

Equation:

$$Y = -0.787 + 0.015 \cdot X_{N1} + 0.121 \cdot X_{N2} + 0.054 \cdot X_{N3} + 0.014 \cdot X_{N4} + 0.004 \cdot X_{N5} + 0.076 \cdot X_{N6} + 0.014 \cdot X_{N7} + e$$

Legend:

Y = Alcohol and Drug Abuse Risk

X_{p1} = Combat Exposure

X_{p2} = Daily Stress

X_{p3} = Loneliness

X_{p4} = Moral Injury

X_{p5} = Self-Stigmatization

X_{p6} = Suicide Risk

X_{p7} = History of Traumatic Brain Injury

e = error term

Model 3		Coefficients ^a		t	Sig.
		B	Std. Error		
1	(Constant)	-0.787	0.101	-7.824	
	Combat Exposure	0.015	0.005	2.906	<0.001
	Daily Stress	0.121	0.019	6.326	0.004
	Loneliness	0.054	0.019	2.845	<0.001
	Moral Injury	0.014	0.003	5.169	<0.001
	Self-Stigmatization	0.004	0.007	0.688	0.492
	Suicide Risk	0.076	0.010	7.952	<0.001
	History of Traumatic Brain Injury	0.014	0.081	0.169	0.866

a. Dependent Variable: Alcohol and Drug Abuse

MULTIPLE LINEAR REGRESSION

Model 3 Regression Diagnostics

Standardized Error Terms Histogram

Interpretation Statement

Error terms are small. The mean is close to 0, with most values are between -2 and 2. The histogram for the STDE is not bell-shaped and symmetric. Therefore, this model is NOT a good predictor of Y.

MULTIPLE LINEAR REGRESSION

Model 3 Regression Diagnostics

Y versus Standardized Error Terms Scatterplot?

Interpretation Statement

The scatterplot does not show a pattern. Y increases as STDE decreases. Most of the STDE terms are between (-2, 2). Hence, this model is NOT a good predictor of Y.

MULITPLE LINEAR REGRESSION MODEL 3 SUMMARY TABLES

TABLE 1: Descriptive Statistics and Bivariate Associations between Alcohol Abuse Risk and Model 3 Risk Factor* among Veterans in The 2022 Military Health and Well-Being Project from ICPSR Michigan (N=1,495)

	Overall		Test and p-value
	N	Mean (SD) Frequency (%)	
Alcohol and Drug Abuse Risk	1,495		
Combat Exposure(scale)	1,495	11.6 (6.1)	Pearson’s Correlation <0.001
Daily Stress (scale)	1,495	1.6 (1.8)	Pearson’s Correlation = 0.004
Loneliness (scale)	1,495	4.9 (1.9)	Pearson’s Correlation <0.001
Moral Injury (scale)	1,495	40.3 (15.3)	Pearson’s Correlation <0.001
Self-Stigmatization (scale)	1,495	8.8 (5.1)	Pearson’s Correlation = 0.492
Suicide Risk (scale)	1,495	5.3 (3.7)	Pearson’s Correlation = <0.001
History of Traumatic Brain Injury (binary)	1,495		Pearson’s Correlation = 0.866
No		1243 (83.1%)	
Yes		252 (16.9%)	
**Denote p value < 0.5			

*Combat Exposure, Daily Stress, Loneliness, Moral Injury, Self-Stigmatization, Suicide Risk, and History of Traumatic Brain Injury

MULITPLE LINEAR REGRESSION Summary Tables

TABLE 2: Model 3 Risk Factors* Independently Associated with Alcohol and Drug Abuse Risk using Multiple Linear Regression among Veterans in The 2022 Military Health and Well-Being Project from ICPSR Michigan (N=1,495)

Measures	β	p-value					
Constant	-0.787				R=	0.4913	
					R ² =	0.2414	
					Overall p-value	<0.001	
Combat Exposure (scale)	0.015	<0.001#					
Daily Stress (Scale)	0.121	0.004#					
Loneliness (Scale)	0.054	<0.001#					
Moral Injury (Scale)	0.014	<0.001					
Self-Stigmatization (Scale)	0.004	0.492					
Suicide Risk (Scale)	0.076	<0.001#					
History of Traumatic Brain Injury (Binary)	0.014	0.866					

Denotes p-value < 0.05

*Combat Exposure, Daily Stress, Loneliness, Moral Injury, Self-Stigmatization, Suicide Risk, and History of Traumatic Brain Injury

MULTIPLE LINEAR REGRESSION

Correlation Plot Between all Protective Factor

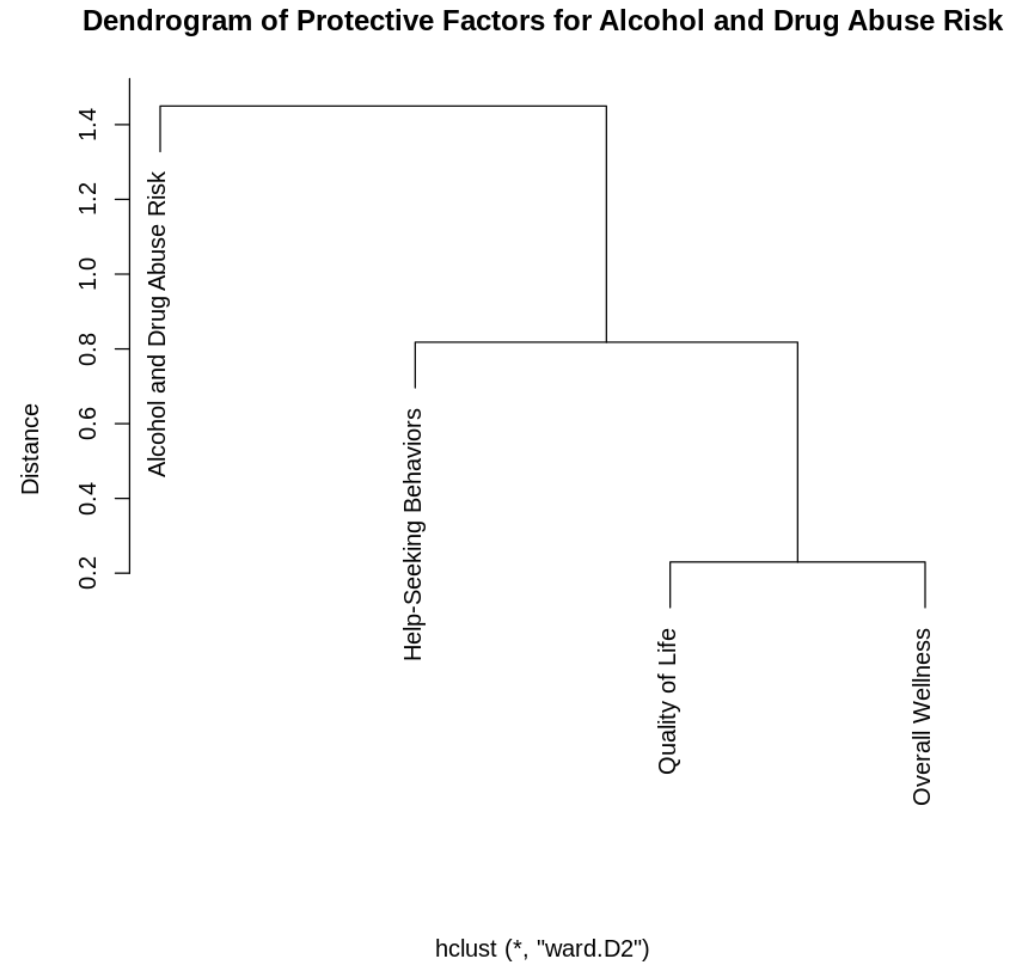

MULTIPLE LINEAR REGRESSION

Pearson's Correlations Between all Protective Factor

	Alcohol and Drug Use Risk	Help-Seeking Behavior	Quality of Life	Overall Wellness
Alcohol and Drug Use Risk	1.000			
Help-Seeking Behavior	-0.000	1.000		
Quality of Life	-0.333	0.279	1.000	
Overall Wellness	-0.340	0.288	0.778	1.000

MULTIPLE LINEAR REGRESSION

Dendrogram for Protective Factors

Interpretation Statement

The dendrogram suggests there may be collinearity between Quality of Life and Overall Wellness.

MULTIPLE LINEAR REGRESSION Summary Tables

TABLE 3: Protective Factors * Independently Associated with Alcohol and Drug Abuse Risk using Multiple Linear Regression among Veterans in The 2022 Military Health and Well-Being Project from ICPSR Michigan (N=1,495)

Measures	Variance Inflation Factors
Help-Seeking Behavior	1.100
Quality of Life	2.555
Overall Wellness	2.569

Interpretation Statement

The Variance Inflation Factors (VIF) for the Protective Factors for Alcohol and Drug Abuse are below 5. Therefore, it suggests a **moderate or low correlation** between predictor variables, indicating that multicollinearity is **unlikely to significantly impact the regression model**. However, the highest VIF value (3.385) suggests some degree of correlation, but it is still within an acceptable range.

MULTIPLE LINEAR REGRESSION

Model 2 REGRESSION ANALYSIS PROTECTIVE FACTORS

R and R²

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	0.3740 ^a	0.1399	0.1381	1.218

a. Predictors: (Constant), Calling and Purpose, Community Engagement, Help-Seeking Behaviors, Military Calling, Quality of Life Score, Public Service Motivation and Wellness

Interpretation Statements

There is no correlation between Alcohol and Drug Use and Help-Seeking Behaviors, Quality of Life Score, and Wellness (R = 0.381).

14.1 % of the variance in Alcohol and Drug Use is explained by Calling and Purpose, Community Engagement, Help-Seeking Behaviors, Military Calling, Quality of Life Score, Public Service Motivation, and Wellness.

MULTIPLE LINEAR REGRESSION REGRESSION ANALYSIS

Model 1 Regression Equation with Legend

Equation:

$$Y = 2.999 + + 0.036 * X_{p3} - 0.014 * X_{p5} - 0.015 * X_{p7} + e \text{ (no significant change in the model)}$$

Legend:

Y = Alcohol and Drug Abuse Risk

X_{p1} = *Calling and Purpose*

X_{p2} = *Community Engagement*

X_{p3} = **Help-Seeking Behavior**

X_{p4} = *Military Calling*

X_{p5} = **Quality of Life**

X_{p6} = *Public Service Motivation*

X_{p7} = **Overall Wellness**

e = error term
